Personal Portfolio Website – Project Documentation

1. Project Review

This project is a personal portfolio website created using HTML. The main goal is to showcase my profile, skills, and contact information in a structured and user-friendly way.

The website includes:

- About section (personal introduction)
- Skills section (technical skills)
- Contact section (form for communication)

The **objective** of this project is to demonstrate my understanding of basic web development concepts like HTML structure, semantic tags, navigation, and forms.

2. Setup Instructions

- Create a folder named "**week 1 - Project Personal Portfolio Website**"
- Inside it, created a **index.html** file and images folder - under **images** folder: **profile.jpeg** file
- Saved my HTML code in index.html file
- Open the file using any browser (Chrome, Edge, etc.)

No installation required because this is a pure HTML project

3. Code Structure

The project follows a simple and organized structure:

- week 1 - Project Personal Portfolio Website (folder)
    - Index.html (file)
    - Images (folder)
        - profile.jpeg (file)

Inside the HTML file:

- <head> → Contains metadata and title
- <body> → Contains visible content

Main sections:

- <header> → Name and navigation
- <main> → Core content
- <section> → About, Skills, Contact
- <footer> → Bottom navigation

4. HTML Concepts Used

- **Semantic Tags**: Used for better structure and readability
  Example: `<header>`, `<main>`, `<section>`, `<footer>`

- **Navigation:** Used for internal linking between sections
  Example: `<a href="#about">`

- **Image Tag:** Used to display profile picture
  Example: `<img src="..." alt="...">`

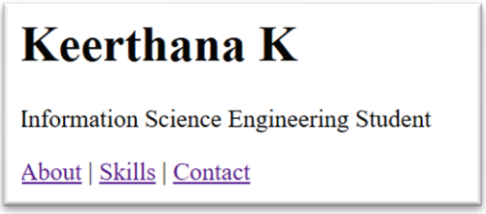
- **Lists:** Used to display skills in an organized format
  Example: `<ul>`, `<li>`

- **Forms**: Used to collect user data
  Example: `<form>`, `<input>`, `<textarea>`

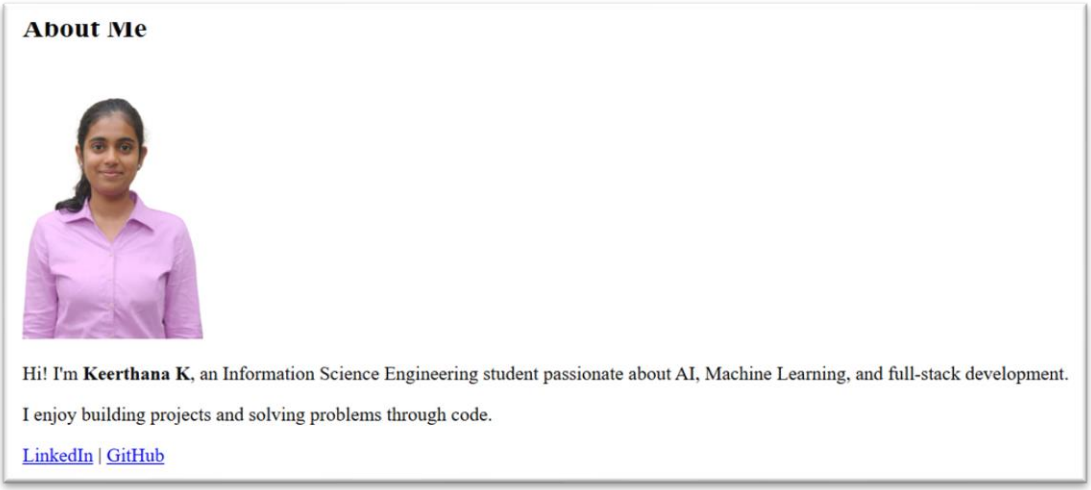
- **Attributes**: Used for input validation and better user experience
  Example: `required`, `minlength`, `placeholder`

5. Visual Documentation

1. Full homepage

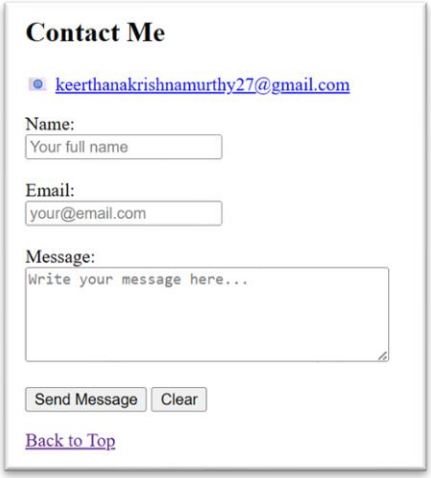


2. About section



3. Skills section

4. Contact form



The screenshots demonstrate:

- Clean layout
- Proper section separation
- Functional navigation links

6. Technical Details

- No complex algorithms are used (static website)
- Data is structured using HTML elements
- Form validation is handled using HTML attributes
- Architecture follows a single-page structure

7. Testing Evidence

Test cases performed:

- Navigation Links
    - Clicking "About", "Skills", "Contact" scrolls correctly
- Form Validation
    - Empty fields → error shown
- Short input → rejected
    - Email Validation
- Invalid email → not accepted
    - Image Loading
- Profile image displays correctly

Hence the portfolio is structured as a single-page website with internal navigation links. Each section is identified using unique IDs, allowing smooth navigation without reloading the page.

GitHub Repository Structure

The project is organized in a clean and structured format in the GitHub repository:

- week 1 – Project Personal Portfolio Website
    - index.html
    - README.md
    - Images
        - Requirements.txt

- ✓ index.html
  This is the main file that contains the complete structure of the portfolio website.
- ✓ README.md
  This file includes project details such as description, features, and instructions to run the project.
- ✓ images
  This folder stores all image assets used in the website, such as the profile picture.
- ✓ requirements.txt
  This file is generally used in projects with dependencies (like Python).
  Since this is a pure HTML project**,** it is not required but can be included for future extensions.
